

SAVE MONEY AND CUT CO2

POWEROUT

5TM

The easy way to
automatically
shutdown / hibernate
& wake up PCs

Every business constantly strives to keep control of costs, eliminate waste, improve profit margins and to be socially responsible. Ensuring PCs are powered down at nighttime and weekends goes a long way to doing all these things.

PowerOut™ is the essential tool to cut your costs, reduce carbon output and improve your environment.

With PowerOut™ you can make a difference today.

When a PC is left on 24/7 it costs money in electricity, as much as £100 per year; and releases CO2 into the atmosphere needlessly. Multiply that by the number of PCs that do get left on, and it can add up to a substantial amount of money and CO2.

All new **PowerOut 5™** lets you set a time of day you want all unused PCs safely shutdown or put into a hibernate state. You can also set a time to wake PCs up leaving the time in-between as pure savings.

The effect of good power management can contribute hugely to the bottom line and help in the global fight against CO2 emissions.

PowerOut™ is a truly flexible power management tool that's a must for any organisation serious about profits, the environment and the future.

PowerOut makes sense

If you think about it you wouldn't leave the lights on all night, but unfortunately in many instances the PC goes under the radar, until now that is.

Just install **PowerOut™** and start saving from day one by shutting down PCs that aren't in use.

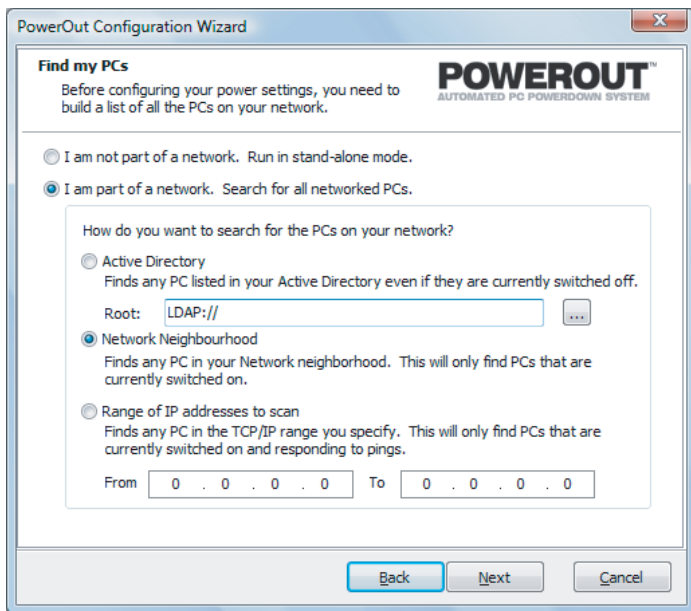

A PC that's left on 24/7 can easily waste £100 per year and release as much as 750lbs of CO2 into the environment, equivalent to a 900 mile car trip.

Energy saving with **PowerOut™** is perfectly safe and you won't lose any data. There are also added benefits like reducing the strain on your air conditioning, increased PC security and longer component life.

Because **PowerOut™** reports on money saved and CO2 reduction it's easy to see for yourself just how cost effective it really is.

Efficiency in just minutes

Install **PowerOut™** and automatically locate your networked PCs using Network Neighbourhood, Active Directory or IP Address.

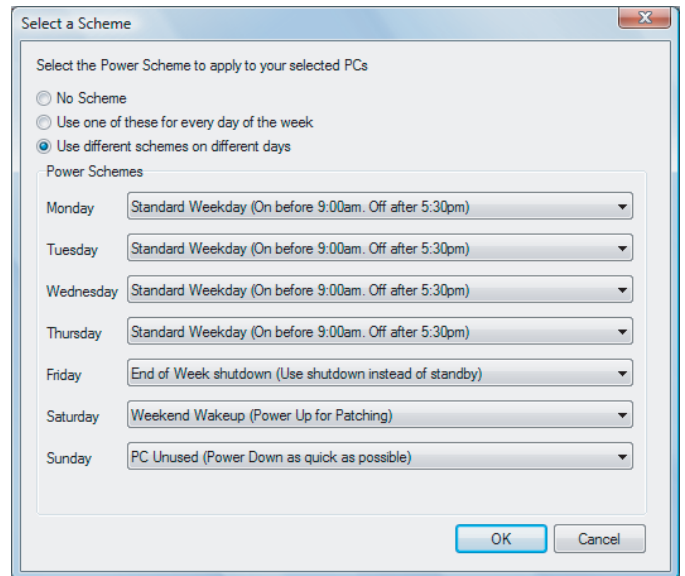

Then decide what time you want the PCs to shutdown or hibernate and what time to wake them up.

Simply deploy your profiles to the chosen PCs and when the desired time arrives any PCs that have been left on will automatically shutdown, saving you money until it's time to wake up.

You can have different profiles for different PCs and put PCs into groups for ease of distribution. **PowerOut™** only shuts down PCs that haven't been in use for a predefined period of time and it overrides device drivers that incorrectly stop normal Windows shutdown from working.

You can easily exclude essential PCs like servers.

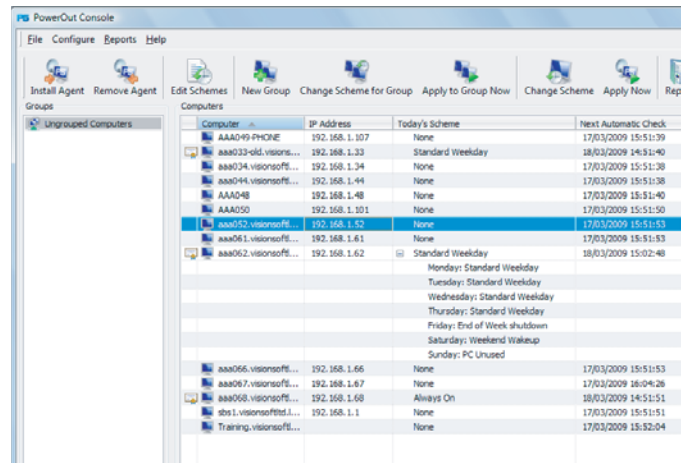

Flexible solution

PowerOut™ lets you design different power settings for different days and you can easily change settings on the fly.

You can design profiles with multiple wake and sleep events to accommodate scheduled maintenance like anti virus updates, allowing you to maximise your energy savings.

Total control

PowerOut™ keeps you in control by being able to analyse, modify and distribute power settings to all your PCs from one central console and because it's used as standard on hundreds of thousands of corporate PCs, you know you're keeping good company.
